

TawaRemo

Tower Crane Remote Control "TawaRemo"

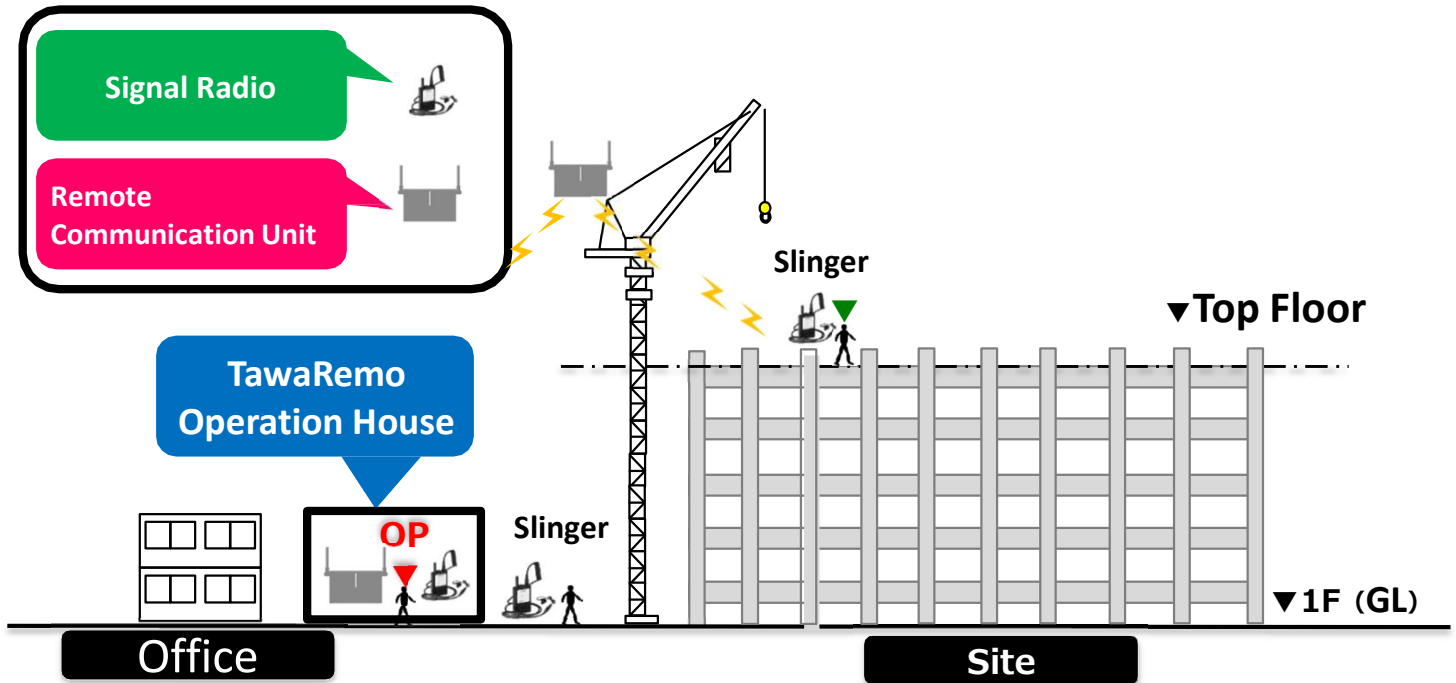

- By installing a tower crane equipped with this system, remote control becomes possible!!
- Eliminates the need to ascend and descend to the high-altitude operator's cab, significantly reducing the burden on the operator!
- Contributes to improved productivity by facilitating shorter work hours and emergency response!

-Transmits vibrations to the remote control room
-Reproducing a sense of presence

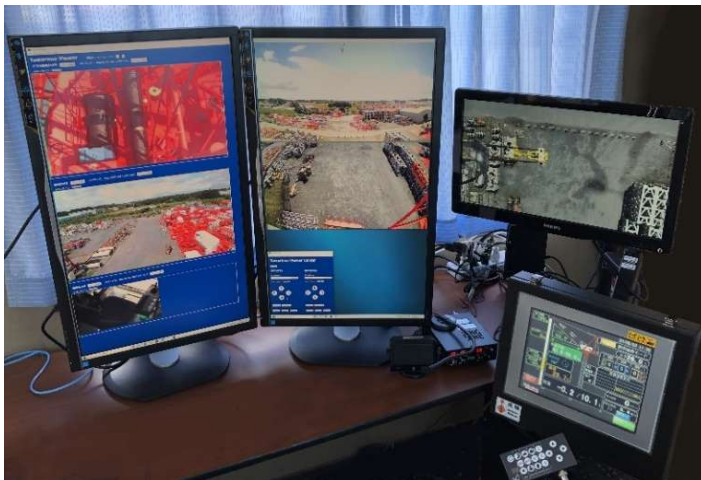

2 types to choose from
depending on your budget
and application

Remote Communication Image Outline

Adopts a system compatible with various communication line standards

For short-distance remote operation within the site, operation is possible using a local network such as a wired or Wi-Fi line.

Status of the operation screen

At the actual site, accurate operation is made possible by receiving camera images and vibration signals sent from the crane to the remote operation seat, as well as radio signals from the signal person.

From the remote operation seat, the operation signal is sent to the crane simply by operating a lever built similarly to the actual crane's control lever, and the crane can be moved.
